"Kunitz-type proteinase inhibitors derived by limited proteolysis of
the inter-alpha-trypsin inhibitor. VII. Characterization of the
bovine inhibitor as double-headed trypsin-elastase inhibitor.";
Hoppe-Seyler's Z. Physiol. Chem. 364:1689-1696(1983).
-!- FUNCTION: ALPHA-1-MICROGLOBUIN OCCURS IN MANY PHYSIOLOGICAL
FULUDS INCLUDING PLASHA, URINE, AND CERBEROSFINAL FLUID. IT
APPEARS NOT ONLY AS A FREE MONOMER BUT ALSO IN COMPLEXES WITH IGA
                                                                                                                                                                                                                             AMBP_BOVIN STANDARD; PRT; 352 AA.

                                                           STIMULUS TO ACT AS STRUCTURAL LINKER THAT ENSURE NORMAL CUMULUS EXPANSION, THROUGH STABILIZATION OF THE CUMULUS EXTRACELLULAR MATRIX THUS SUPPORTING THE PROCESS OF OVULATION.
SUBDIT: I-ALPHA-I plasma protease inhibitors are assembled from one or two heavy chains (H1, H2 or H3) and one light chain, bikunin. Inter-alpha-inhibitor (I-ALPHA-I) is composed of H1, H2 and bikunin, inter-alpha-like inhibitor (I-ALPHA-LI) of H2 and bikunin, and pre-alpha-inhibitor (P-ALPHA-LI) of H3 and bikunin (By

Tinter-alpha-trypsin inhibitor and its related proteins in Syrian hamster urine and plasma.";

J. Biochem. 120:145-152(1996).

-!- FUNCTION: ALPHA-1-MCROGLOBULIN OCCURS IN MANY PHYSIOLOGICAL FUNDING PLASMA, URINE, AND CEREBROSPINAL FUID. IT APPEARS NOT ONLY AS A FREE MONOMER BUT ALSO IN COMPLEXES WITH IGA AND ALBUMIN (BY SIMILARITY).

-!- FUNCTION: INTER-ALPHA-TRYPSIN INHIBITOR, PRESENT IN PLASMA AND URINE, INHIBITS TRYPSIN, PLASMIN, AND LYSOSOMAL GRANULOCYTIC ELASTASE (BY SIMILARITY).

-!- FUNCTION: Trypstatin is a trypsin inhibitor. It inhibits blood coagulation factor Xa and tryptase about 100-fold more rapidly than portine pancreatic trypsin and chymase. It is a monomer but is also found in mast cells as a complex with tryptase (By
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 AMBP_MESAU STANDARD; PRT; 349 AA.

SUBDIVIT: I-ALPHA-I plasma protease inhibitors are assembled from one or two heavy chains (H1, H2 or H3) and one light chain, blundin. Inter-alpha-inhibitor (I-ALPHA-I) is composed of H1, H2 and blkunin, inter-alpha-like inhibitor (I-ALPHA-I) of H2 and blkunin, and pre-alpha-inhibitor (P-ALPHA-I) of H3 and blkunin (BY

PLUIDS INCLUDING PLASMA, URINE, AND CEREBROSPINAL FLUID. IT

APPEARS NOT OUL AS A FREE MONOMER BUT ALSO IN COMPLEXES WITH IGA

AND ALBUMIN (BY SIMILARITY).

-I- FUNCTION: INTER-ALPHA-TRYPSIN INHIBITOR, PRESENT IN PLASMA AND

C ILLASTASE (BY SIMILARITY).

-I- SUBUNIT: I-ALPHA-I plasma protease inhibitors are assembled from

One or two heavy chains (H., H2 or H3) and one light chain,

bikunin. Inter-alpha-inhibitor (I-ALPHA-I) is composed of H1, H2

and bikunin, inter-alpha-inhibitor (I-ALPHA-II) of H2 and

bikunin, and pre-alpha-inhibitor (P-ALPHA-II) of H3 and bikunin (By

Rasp G., Hochstrasser K., Gerl C., Wachter E.;

"Primary structure of a proteinase inhibitor released from goat serum inter-alpha-trypsin inhibitor.";

Biochim. Biophys. Acta 999-335-337(1989).

-!- FUNCTION: THIS INHIBITORY FRAGMENT, RELEASED FROM NATIVE ITI AFTER LIMITED PROTEOLYSIS WITH TRYPSIN, CONTAINS TWO HOWOLOGOUS DOMAINS. WHEREAS THE SECOND DOMAIN IS A STRONG INHIBITOR OF TRYPSIN, THE FIRST DOMAIN INTEREACH WEAKLY WITH PANN-CRANULOCYTIC ELASTASE AND NOT AT ALL WITH PANCREATIC ELASTASE.

-!- MISCELLANGOUS: THE AMINO ACID AT POSITION P2' (17) APPEARS TO DETERMINE THE SPECIFICITY OF THE INHIBITION OF DOMAIN I.

INHIBITORS WITH METHIONINE IN THIS POSITION INTERACT WEAKLY WITH CHYMOTRYPSIN AND ELASTASE: THOSE WITH LEUCINE INTERACT STRONGLY.
                                                                                                                                                                                                 Rasp G., Hochstrasser K., Wachter E., Reisinger P.W.M.; "The amino-acid sequence of the trypsin-released inhibitor from sheep inter-alpha-trypsin inhibitor."; Inter-alpha-trypsin inhibitor."; Biol. Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

                                                                                        A glycosaminoglycan binding peptide (AAW06879) derived from tissue factor pathway inhibitor is used in novel chimeric proteins of formula A-R1-B-R2-C, where A and C are peptides (AAW06875-79, AAW06883-90) capable of binding glycosaminoglycans (esp. heparin) present on cell surfaces, R1 is membrane co-factor protein (MCP) or decay accelerating factor (DAF), R2 is DAF when R1 is MCP or MCP when R1 is DAF, and B is a peptide that may have complement inhibitor activity. The chimeric proteins (see also AAW06882) are directed to cell surfaces where they inhibit complement-mediated cell lysis. They are used to treat and prevent disease states in which complement plays a role, e.g. sepsis, adult respiratory
comprise membrane co-factor protein and decay accelerating factor
                                                                                                                                                                                                                                                                                                                                                                                                                                ó;
                                                                                                                                                                                                                                                                                                                                                                                           Length 23;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Takemoto
                                                                                                                                                                                                                                                                                                                                                                                                                                Indels

The sequences given in AAR92257-64 represent first, second and third
Kunitz-type domains and the C-terminal tails derived from tissue
factor pathway inhibitor (TPPI) and TPPI-2. These sequences are
inpuly basic and may be involved in cell surface localisation by
glycosaminoglycan (including heparin) or phospholipid binding.
These sequences may be used in the construction of the chimeric
proteins or muteins of the invention. These muteins have one or
more substitutions exclusively in the P1-reactive site of one or
more Kunitz-type domains. The chimeric proteins may comprise an
alternative glycosaminoglycan binding peptide selected from those
alternative glycosaminoglycan binding peptide selected from those
characterical composition for the treatment of sepsis, septic shock and
thrombosis disorders. The proteins may be generally useful in the
thrombosis disorders. The proteins may be generally useful in the
treatment of diseases caused by the up-regulation of tissue factor
bought on by injury, trauma, endotoxin, TNF, cancer, IL-1 or other
                                                                                                                                                                                    ó
                 restenosis after angioplasty, luminal stenosis after vascular transplantation, and leiomyosarcoma. AAW21910-12 are specific inhibitory peptides based on the generic Pl and P2 sequences shown in AAW21905 and

The sequence represents an angiotensin converting enzyme splice variant (ACEV) polypeptide. The polypeptides of the invention include variants of granulocyte colony stimulating factor receptor, glucagon, interleukin 6, platelet-derived endothelial cell growth factor, cyclin-dependent kinase inhibitor IC, cellular tumour antigen P53, and vasoactive intestinal polypeptide receptor 2. The polypeptides and their associated nucleic acids are useful for identification of variant sequences and detection of candidate compounds capable of binding the molecules. The sequences of the invention can be used in the treatment and diagnosis of various consistence including cardiovascular diseases such as arteriosclerosis, myocardial infarction and coronary arterial thrombosis, renal diseases such as diabetic nephropathy, muscular diseases such as hypertrophy, immune disorders such as immune complex nephritis, multiple sclerosis, cancer, sarcoidosis, nonarcoidotic pulmonary granulomatous diseases such as asbestosis and vascular pathologies involving an endothelial

```
(TFPI). This sequence has a Lys to Arg mutation in the PI-reactive domain of the first Kunitz-type domain. The Kunitz-type domains are highly basic sequences and may be involved in cell surface localisation by glycosaminoglycan (including heparin) or phospholipid binding. Muteins such as this, having one or more substitutions exclusively in the PI-reactive site of one or more Kunitz-type domains are covered by the scope of the invention. Chimaric proteins comprising the kunitz-type domains from TFPI or TFPI-2, may also comprise an alternative glycosaminoglycan binding peptide selected from those given in ARR92266-73. The chimaric proteins and muteins may be used in a pharmaceutical composition for the treatment of sepsis, septic shock
                                                                                                                                                                                                                                                                                       Kunitz-type domain; C-terminal tail; tissue factor pathway inhibitor; TFPI: TFPI-2; cell surface localisation; glycosaminoglycan; heparin; phospholipid; binding; chimeric protein; mutein; substitution; PI-reactive site; sepsis; septic shock; thrombosis; up-regulation; tissue factor; injury; trauma; endotoxin; TNF; cancer; IL-1; tumour necrosis factor; interleukin.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          A mutein (AAR92012) of tissue factor pathway inhibitor (TFPI) is prepd. by site-directed mutagenesis of an encoding sequence. In the mutein, the lysine residue in the Pl reactive site of the first Kunitz-type domain of TFPI is replaced by arginine. This domain is required for the inhibition of Factor-VIIa/tissue factor (TF) complex. The mutein may be expressed in Saccharomyces cerevisiae transformants, esp. as a ubiquitin fusion protein,
                                                                                                                                                                                                                                                                                                            ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ö

```

```
This sequence represents the human tissue factor pathway inhibitor (TFPI) protein. TFPI is also known as Lipoprotein-associated coagulation inhibitor (LACI), extrinsic pathway inhibitor (EPI) and Tissue factor inhibitor (TFI). The DNA encoding this sequence was altered to contain the optimum codons for expression in E. coli, to allow for expression of this protein in the bacteria. TFPI is used in the aqueous formulation of the invention. The aqueous formulation also includes a charged polymer (CP), preferably a sulphated polyacocharide (such as heparin or dextran sulphate) or a polyphosphate, preferably immobilised on a soil support. The CP is added to add the correct refolding of TFPI. TFPI can also be modified or refolded using the methods of the invention. One method is for a CP to reduce inter- and intra-molecular interactions between the charged domains of the protein. The second method is for refolding an immobilise of denatured protein. TFPI is and comprises adding the a solution of the protein prior to allowing the protein to refold. The methods are particularly useful for solubilising, formulating,
                                                                                                                                                        Tissue factor pathway inhibitor; TFPI; human; tissue factor inhibitor; ilipoprotein-associated coagulation inhibitor; coagulation inhibitor; TFI; LACI; extrinsic pathway inhibitor; protein refolding; clot-inhibitor; protein solubility modification; EPI.
                                                                                                                                                                                                                                                                                                  /note= "phosphorylated to varying degrees, but does not
    affect TFPI function"
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             charged polymer, e.g. dextran sulphate, to facilitate solubilisation, formulation purification and refolding of protein
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Aq. formulation of tissue factor pathway inhibitor - contains

The present sequence represents the human tissue factor pathway inhibitor (FPPI). The invention provides compositions using TFPI and its homologs, e.g. TFPI-2 (AAM61586), for inhibiting cell proliferation. The compositions are claimed to be useful for inhibiting an anglogenesis-related disease, such as cancer, arthritis, macular
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Non-glycosylated; tissue factor pathway inhibitor; TFPI; multivalent; lipoprotein associated coagulation inhibitor; inhibitor; Kunitz-type; coagulation; domain; factor VIIa; LACI; tissue factor; factor Xa; complex; coagulation.

pathway inhibitor (TFPI). TFPI is alternatively known as lipoprotein associated coagulation inhibitor (LACI). TFPI is a multivalent kunitz-type inhibitor of coagulation. The primary amino acid sequence of TFPI shows that it contains a highly negatively charged amino terminus, three tandem kunitz-type inhibitory domains and anity positively charged carboxyl terminal. The first kunitz domain of TFPI is needed for the inhibition of factor VIIa/Tissue factor complex and the second kunitz domian of TFPI is responsible for the inhibition of factor VIIa/Tissue factor is unknown. TFPI is thought to act in vivo to limit the initiation of coagulation by forming an inert, quaternary factor Xa:TFPI:factor
                                                                                                                                                                                                                         Gaps

Amino acid sequence of tissue factor inhibitor (TFI) cDNA isolate from lambda-P9 clone of human placenta cDNA library. Domains discerned include: highly negatively charged N-terminal; highly positively charged carboxy-terminal; intervening portion consisting of 3 homologous domains with sequences typical of Kunitz-type enzyme inhibitors. Based on homology study, it appears to be a member of the basic protease inhibitor gene superfamily. Sequences in misc. regions in feature table above have been independently confirmed by amino acid sequence analysis.
                                                                                                                                                                                                                                                                                         Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Kallikrein inhibiting proteins comprising a Kunitz domain homologous to bovine pancreatic trypsin inhibitor - useful for preventing or treating disorders attributable to excessive kallikrein activity, egg. in hereditary angloedema.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Lipoprotein-associated coagulation inhibitor; LACI; kallikrein; inhibitor; KIP; Kunitz domain; hereditary angloedema.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The amino acid sequence of the human lipoprotein-associated coagulation inhibitor (LACI). The sequence encoding the K1 domain was used to generate a library of peptides which act as inhibitors of plasmin. The peptides (see ARR78390-R78599) are mutants homologous to bovine pancreatic trypsin inhibitor (BPTI) Kunitz domains that inhibit plasmin. The peptides can be used to prevent or treat a clinical condition exacerbated by plasmin e.g. inappropriate fibrinolysis or
            AAR81884 is the human lipoprotein-associated coagulation inhibitor LACI. The Kunitz domain, LACI-KI, of LACI is a kallikrein in inhibiting protein (KIP) upon which the claimed KIPs of the invention are based. The KIPs can be used for treating or preventing disorders
                                                                        attributable to excessive kallikrein activity, e.g. hereditary angioedema. The KIPs can also be used for assaying, purifying and in vivo imaging of kallikrein.
                                                                                                                                                                                                     Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Novel plasmin inhibiting protein comprising a Kunitz Domain - useful to prevent/treat disorders attributable to excess plasmin activity.
                                                                                                                                                                                                     .

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                A Sall fragment encoding human tissue factor pathway inhibitor (TFPI) is given in AAQ81396. It was used to contruct expression vectors allowing production of TFPI in Saccharomyces cerevisee as fusions to the yeast aspartic protease 3 (TAPA) signal peptide, facilitating secretion of the recombinant TFPI.

The nucleic acids, and primers and probes, are used to identify polymorphisms, which may predispose an individual to disease, especially a vascular disease. They can also be used in phenotype correlations, forensics, paternity testing, medicine or genetic

```
The present amino acid sequence is the mutant human tissue factor pathway inhibitor (FTPI) protein. A single nuclectide substitution (CTP) in exon 7 of the TFPI wild type gene, leads to a proline-leucine substitution in the mature peptide. TFPI is a single chain glycoprotein present in plasma in trace amounts, that belongs to the class of Kunitz-type proteinase inhibitors. It is an important regulator in the extrinsic blood coagulation pathway. The mutant TFPI sequence has a new recognition site for the restriction enzyme BseNI, that is useful for in vitro diagnosis
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          useful

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Sequence 10, Sequence 10, Sequence 11, Sequence 11, Sequence 11, Assequence 20, Sequence 20, Sequence 7, Assequence 11, Assequence 1

; Sequence 3, Application US/10086176A ; Patent No. US20020173465A1

RESULT 1 US-10-086-176A-3

```
GENERAL INCOMMATION:
APPLICANT: Hembrough, Todd
APPLICANT: Papathanassiu, Adonia E.
APPLICANT: Papathanassiu, Abonia E.
APPLICANT: Papathanassiu, Abban J.
ITILE OF INVENTION: Compositions and Methods for Inhibiting Cellular Proliferation
ITILE OF INVENTION: TFPI Fragments
ITILE OF INVENTION: TPPI Fragments
ITILE OF INVENTION: TPPI Fragments
ITILE OF INVENTION: 1891-0296
CURRENT FILING DATE: 2002-02-28
FRIOR APPLICATION NUMBER: US 09/766,778
PRIOR APPLICATION NUMBER: US 09/227,955
PRIOR PRILING DATE: 1999-01-11
PRIOR PILING DATE: 1999-01-11
PRIOR APPLICATION NUMBER: US 08/796,850
PRIOR PILING DATE: 1997-02-06
PRIOR APPLICATION NUMBER: US 09/130,273
PRIOR FILING DATE: 1998-06-06
NUMBER OF SEQ ID NOS: 6
SOFTWARE: PatentIn version 3.1
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       .;

JUL15sue factor pathway inhibitor precursor - rhesus macaque
N.Alternate names: extrinsic pathway inhibitor; lipoprotein-associated coagulation inhib
C; Species: Macaca mulatta (rhesus macaque)
C; Date: 10.5ep-1999 #sequence_revision 10-Sep-1999 #text_change 21-Jul-2000
C; Accession: JUC2264
R; Kamel, S.; Kamikubo, Y.; Hamuro, T.; Fujimoto, H.; Ishihara, M.; Yonemura, H.; Miyamot
J; Biochem. 115, 708-714, 1994
A; Title: Amino acid sequence and inhibitory activity of rhesus monkey tissue factor path
A; Reference number: JUC264
A; MID:94375417; PMID:8089087
A; Maccession: JUC264
A; MUD:94375417; PMID:8089087
A; Molecule type: mRNA
A; Residues: 1-304
A; Multiple minibitor the activities of factor Xa and tissue factor-factor VI
C; Comment: This protein inhibits the activities of factor Xa and tissue factor-factor VI
C; Comment: This protein inhibits the activities of factor xa and tissue factor-factor VI
C; Superfamily: tissue factor pathway inhibitor; animal Kunitz-type proteinase inhibitor
C; Reywords: anticoagulant; glycoprotein; serine proteinase inhibitor
F; 1-28/Domain: adjund sequence #status predicted <SIG>

Spains factor pathway inhibitor - rabbit
C;Species: Oryctolagus cuniculus (domestic rabbit)
C;Species: Oryctolagus cuniculus (domestic rabbit)
C;Date: Ol-Aug-1995 #sequence_revision 01-Sep-1995 #text_change 16-Jul-1999
C;Accession: S53325
R;Girard, T.J.; Gallani, D.; Broze Jr., G.J.
Biochem. J. 303, 923-928, 1994
A;Title: Complementary DNA sequencing of canine tissue factor pathway inhibitor revea
A;Reference number: S53325
A;Accession: S53325
A;Accession: S53325
A;Accession: S53325
A;Residues: prellminary
A;Molecule type: mRNA
A;Molecule type: mRNA
A;Molecule type: mRNA
C;Superfamily: animal Kunitz-type proteinase inhibitor homology
C;Keywords: serine proteinase inhibitor homology RPD>
